xtrabunger.github.io

Skills

- **Engineering Methods:** FMEA, GD&T engineering drawings, Material Selection, Mechanism design, Risk assessment, Technical documentation
- **Programs:** Git, Linkage, MATLAB, SAM, SolidWorks, Visual Studio Code
- **Misc. Skills:** Cross-disciplinary team coordination, Microsoft Office Suite, Prototyping, Technical report writing, WHMIS

Education & Certification

- **Bachelor of Applied Science** **Sep 2023-Present**
 - Simon Fraser University, Burnaby BC
 - GPA: 3.73/4.33
 - **Dean's Honour Roll** **6/7 Eligible Semesters**
 - **President's Honour Roll** **Summer 2025**
- **Relevant Coursework:** Digital System Design, Mechanical Design, Statics and Strength of Materials, Graphical Communications

Technical Projects

Modular Transforming Home Robot **Jan-Apr 2026** Introduction to Mechanical Design (ENSC 386), SFU

- Designed a modular transforming robot in a 3-member group to perform various household tasks featuring a 5-DoF articulated arm assembly modeled in SolidWorks, featuring a telescoping link, a jackknife compound link, and a bayonet-mount wrist interface
- Produced detailed engineering drawings and assembly drawings in SolidWorks and a bill of materials, applying GD&T standards to tolerances and fittings across each component
- Consulted a practicing engineer to apply industry naming and version control standards while maintaining an organized drawing file and model revision system across multiple iterations

RISC-V Execution Unit **Jan-Apr 2026** Digital System Design (ENSC 350), SFU

- Designed and implemented a RISC-V execution unit in a 3-member team, delegating tasks based on individual strengths, resolving technical disagreements between teammates, and utilizing Microsoft Outlook to facilitate team coordination
- Produced technical documentation including reports, test logs, and execution summaries using Microsoft Word, maintaining organized records throughout the project using Microsoft Excel
- Delivered a fully functional execution unit optimized across multiple subsystem configurations, balancing cost-performance trade-offs while maintaining correctness across 40 test vectors covering primary and edge cases

Orange Peel Grabber Redesign **Sep-Dec 2024** Graphical Communication for Engineering (ENSC 204), SFU

- Redesigned a hydraulic orange peel grabber as a mechanical system in a 2-member team, replacing hydraulic actuation with a mechanical mechanism and adapting claw geometry for fine material handling
- Specified material selections for structural components and produced GD&T engineering drawings for all parts in accordance with ASME Y14.5, verifying dimensional relationships & tolerances through comparison against real-world grabber dimensions
